Q71 — an all-round view has never been more complete!

When it comes to providing a 360° all-round view by day and night, never before have you experienced hemispheric camera technology that is so compact, so complete and so versatile. **12 megapixels (4K visible)** and WDR ensure **brilliant image quality and impressive detail**. The audio function rounds off the range of features offered by this powerful piece of equipment. Everything is optimally protected in the weather-resistant aluminum housing, meaning that the camera can be deployed both inside and outside for discreet and reliable use.

IR and white light combined — make the night colorful!

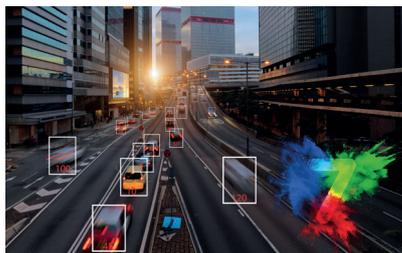

For the first time, **day and night sensors, infrared** and **LED white light** are combined in a single hemispherical camera. This means that the Q71 delivers brilliant images around the clock — and thanks to the LED, **even the night can be viewed in spectacular color!**

Panoramic view — WDR ON

Keep an eye on everything — and delve into impressive detail when needed

The hemispheric lens captures the whole picture. Thanks to the built-in deskewing operation in the camera, you can select your preferred display for the screen. Choose from: **360° fisheye view, normal view, panoramic view** or **quad view**, which displays the scene via four images at once. This allows you to zoom in on a single frame in real time without disturbing the whole picture. You can decide at the touch of a button whether you would prefer to see an overview of the whole scene or focus on individual details.

MOBOTIX 7 — an open platform for your video analysis

Intelligent apps for video analysis can be integrated into the Q71. In addition to pre-integrated analysis functions such as **object counting, heat mapping and behavior detection**, you can also set up and use additional new individual apps in the system. The possibilities are endless!

An effective and budget-friendly option for a variety of industries

- Promote sales in retail: Analyze the movement of customers in stores
- Support nursing staff by detecting people in need of assistance
- Provide security in industry and logistics through monitoring production hall and warehouse areas in their entirety
- Day and night perimeter protection: Monitor outside areas to protect against intruders (also detect the color of clothing and cars at night)
